

air BRIDGE

Radio Router to RS485 Modbus/RTU,

Code: M62002. **DESCATALOGADO**

Description

The "airBridge" is a Router Bridge from RS485 to radio. The purpose of this equipment is to permit communication with standard Modbus devices using the "airLINK" network infrastructure. The device requires an AC or a DC power supply in order to keep communication. For network purposes, it has the active function of maintaining radio traffic from and to other similar devices. It can also act as a parent device for battery-powered sensors of the same family.
