

air HANDZER

Portable wireless signal coverage analyzer,

Code: M62005. **DESCATALOGADO**

Description

The airHANDZER, is a remote supervisor used for the comissioning of radio communication networks type "airLINK". The equipment allows to know the number of routers that can be accessed from the particular location where it is located (Ping Test) and displays information about the intensity of the radio signal received from each of them, thus identifying the quality of radio links. Its use is not required during normal operation of the network, but it can play the role of remote supervisor. During the limited time that remains active in the network, the airHANDZER acts as a router without the usual radio traffic maintenance functions. Thus, it allows to determine whether a certain location chosen for installing new devices has sufficient coverage.

air HANDZER

Code: M62005.
