

RMV-260-100-100

RMV-260-100-100, Choke reactor

Code: R80664.

> In (A): 100

Description

Choke REACTORS are required to limit the transient currents produced during the connection of capacitors. CIRCUTOR's RMV units are encapsulated in epoxy resin, which guarantees the degree of insulation required.

Application

The connection of capacitor banks has very high associated transient currents and voltages. The IEC 60871-1 Standard defines the maximum value that can be supported by a capacitor bank as the peak connection value. This value is 100 times its nominal current.

When this value is exceeded, RMV choke REACTORS must be installed. These REACTORS are in charge of limiting the transient current to values that can be supported by the capacitors. The inductance value is variable, depending on the installation's conditions and, basically, on the following parameters:

- Short-circuit power of the installation
- Existence of more capacitor banks
- Interrupting power of automatic switches. The peak current value of the residual connection must also be lower than the interrupting power of the switch unit after the reactor has been installed.

RMV-260-100-100

Choke reactor for capacitor banks

Code: R80664.

Specifications

Mechanical characteristics

Size (mm) width x height x depth	370 x 290 x 110 (mm)
Material	Encapsulated in resin, Air core.
Envelope	colour RAL 8016
Fastening	M12 / M16, depending on the type
Weight (kg)	13

Current measurement circuit

Nominal current (In)	43 In / 1 s
----------------------	-------------

Standards

Standards	IEC 60289

Selection parameters for RMV reactances are: * Maximum operating current (1,43 In) * Required inductance in μ H * Isolating voltage kV The isolating voltage is 12 kV (28/75). Other voltages on request Thermal current is 43 In / 1 s. Other values on request Other currents and μ H please request Price.
